Production Information

# HyboFOAM® E

### Introduction

HyboFOAM® E is a closed-cell rigid foam based on polymethacrylimide (PMI), which contains no halogen at all. The cell size is tiny and uniform。

## Processing and production

HyboFOAM® E can withstand a medium temperature curing process with a maximum temperature of 180 °C and a maximum pressure of 0.3 MPa, depending on the density. Suitable for curing methods such as autoclave, vacuum bag, RTM, VARTM, VARI, HP-RTM, etc.

Due to its excellent surface resin absorption, engineers can find a perfect balance between peel strength and lightweight requirements.

## **Application**

The application of **HyboFOAM® E** is pretty wide. Basically, due to unique density distribution and excellent dielectrics property, it is often used in radome, antenna, electronic, and acoustic equipment.

## Thermoforming and Shaping

To meet different dimension parts and geometry, it is very easy to shape **HyboFOAM®** E by bonding by various adhesive, and common CNC machine.

HYBO can also directly provide highprecision preformed or ready to use foam core materials with complex or simple geometric shapes.

The above values are typical values for nominal density, and the measured values will vary due to manufacturing deviations. \* Data is based on ASTM standard test methods, but GB or ISO values can be confirmed upon request.
